New for 2015, Central Lift Option for Narrow Transport Planters

Monosem announces the new Central Lift option for select narrow-transport planter toolbars. The Central Lift option is available on planter toolbar configurations from 40' to 66'. Available with either walking tandem axle wheels or track undercarriage, the Central Lift system provides a smoother ride across uneven terrain.

The new walking tandem axles follows road contours and provides better planter weight distribution during transport. The modular frame design centralizes the undercarriage components into a compact and efficient system. An improved hydraulic design utilizes fewer components while providing increased lifting capacity and speed.

If the customer's needs change, the modular design of the Central Lift allows the option to change the undercarriage between tires and tracks with no structural modifications.
