

Precision Vacuum Planters

for Row Crops

New for 2015, Fully Mounted Hitch Option Stacking Planters

Announcing the new **FULLY MOUNTED Hitch Option** for select Monosem stacking tool-bar planters. Rear lift-assist wheels are no longer necessary to help carry the planter.

Through hitch redesign and component reconfiguration, the weight distribution of the planter has been reduced and shifted forward, closer to the tractor. This shift in weight allows Category IV hitch equipped tractors to handle the planter lift and carry without the need for lift-assist wheels.

The absence of lift-assist wheels makes end-of-row operations easier, faster, and much less disturbance to the seed bed. In fields of softer or wetter soils, there is less strain on the tractor since there is no wheels to pull through the soil and caster around during turning operations.

The **FULLY MOUNTED Hitch Option** is available on 12 row Single and Twin-Row stacking planter configurations with standard unit hoppers or with optional 50 bushel capacity Central Seed System. Other options include new design cast iron closing wheels, MonoShox downforce system, and hydraulic row drive.
